

Write Mensa's test and get answers immediately

The test consists of **24 tasks** and the time limit is set at **10 minutes**.

Start by studying the sample data very carefully.

In each task, 3 x 3 figures are given where the last figure has been removed. Your task is to, based on the patterns that appear in the task, determine which figure is missing.

Exempel 1

△	○	□
○	□	△
□	△	?

Options: A (●), B (□), C (▴), D (■), E (○)

Exempel 2

◻	◻	◻
◻	◻	◻
◻	◻	?

Options: A (◻), B (◻), C (◻), D (■), E (◻)

© Mensa Sweden

Note that the result may be misleading if the test is performed more than once. Therefore, make sure that you have the opportunity to perform your best before you start the test.

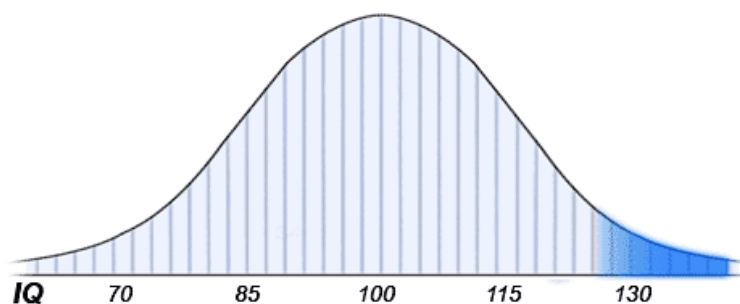

After completing the test, you will find out your estimated IQ, as well as where your result places you in relation to the general population. The result is representative only for people over 18 years, if you are younger than 18 the result will be misleading.

If you are under 18 and think you may be particularly talented, we can offer support through the [GCP - Gifted Children Program](#), do not hesitate to contact us!

The test available on Mensa Sweden's website may not be used without permission from the copyright holder. For more information, [contact us](#).

Here you do the test

Your IQ is estimated to be: **126, or more**

Congratulations! This is the highest result that can be achieved on the test.

Only 4% of the population has an IQ of 126 or more.

Membership in Mensa requires an IQ of 131 or more, which is achieved by 2% of the population, ie the 98th percentile.

You have a good chance of qualifying for Mensa membership. [Feel free to sign up](#) for our admission test and you will find out for sure!

Questions and answers about Mensa's test

Is the test easier than the supervised test?

No. The test is designed with the intention that it should be equally difficult to obtain the corresponding IQ on the supervised test. However, it should be borne in mind that the monitored test measures a little higher on the IQ scale than the test.

What are the similarities between the test and the supervised test?

The graphic design of the test test is in principle identical to the supervised test, and the result of the test test usually gives a good indication of how one can conceivably perform on the supervised test. However, you should be aware that the result of the test is not a guarantee that you can, or cannot, become a member of Mensa.

Why does the test not measure IQ above 126?

All IQ tests have a small margin of error. This is due, among other things, to the impact of chance. Expressed in IQ, it can be said that the standard error is about +/- 5 points. To avoid the test test excluding many potential members due to the margin of error, we have chosen to set the maximum score on the test test to 126.
